

**Abstract**—The purpose of this study was to determine if there were differences in the prevalence of musculoskeletal disorders among different types of workers. The study included 600 male employees from a large manufacturing company who had been employed by the company for at least one year. The study used a self-report questionnaire to collect information about the prevalence of musculoskeletal disorders. The results showed that the prevalence of musculoskeletal disorders was higher among workers in the production department than among workers in the maintenance department. The results also showed that the prevalence of musculoskeletal disorders was higher among workers who reported working longer hours than among workers who reported working fewer hours.
